# *-Gold(&mkts) Charts R Us-*

●●●● GCRU #431 on January 26, 2011 (in its 9<sup>th</sup> year)

Welcome to Gold Charts R Us.

Gold fell sharply hitting a three month low today. And as you'll see below, it's poised to decline further. This weakness also hit silver and the shares, despite the fact that the U.S. dollar has been weak, hitting a two month low today.

Also interesting... demand has been strong. This is coming from China, as it enters its new year, as well as India and individual investors, which has led to shortages. Even so, demand is still low.

As Jeff Clark of BIG Gold (Casey Research) points out, investment demand represented 53% of all gold demand in 1979; today it's only 32%. And according to International Strategy and Investment Group, gold ownership currently represents just 0.6% of total financial assets. If it rose to 1.2% it would still be less than half of its 1980 level. This difference would amount to about 10 years of current global production.

Nevertheless, the fundamentals and the technicals often don't coincide, and this is one of those times. But this also provides us with good profit opportunities by going short.

Naturally, keeping your core positions is important because the major trend remains up. But when the intermediate or short-term trend is weak, shorting is not only profitable, but it provides a hedge against your long or core positions.

Shorting is just as important as going long, especially if the decline is likely to be a steep one as we expect. But with the major trend up, maintain a much larger long position and use your shorts to play the shorter-term outlook. Also, if your long positions are highly leveraged, then lighten up on rallies and hedge.

As you'll see next, this makes good sense, especially for the weeks and possibly months ahead...

## ***A FAVORITE GOLD TIMING INDICATOR***

Leading indicators are our favorites, but some work better than others. In gold's case, our intermediate (medium-term) indicator has worked very well for decades.

Briefly, we developed these indicators over the years. Changes are often seen in the leading indicators before they are apparent in the price, so they assist in anticipating upcoming price movements.

The leading indicators generally help to illustrate when a market is oversold and, therefore, a good buy, or overbought and due for a downward correction or decline. They also help determine when a market has room to rise or decline further because it's not yet overbought or oversold. Overbought and oversold areas are established based on historical high and low levels.

The medium-term leading indicators are helpful in determining when a market is due for an intermediate rise or a downward correction within its major trend. In other words, it tells us the best time to take some profits and when it's time to buy new positions.

Gold, however, is somewhat unique in that it has also formed a recurring cycle, in both its indicator and its price, that goes back to the 1970s. One cycle is made up of four movements, which we call A, B, C and D, and they have certain characteristics (see Page 4).

In a bull market, the recurring rises labeled "C" are the best intermediate upmoves when gold rises to new highs for the bull market. The "D" declines tend to be the worst declines. These are the two most important moves. The As and Bs generally coincide with smaller highs and lows in the gold price, which become consolidation periods.

The latest C rise ended in early January. It was the eighth C rise in this mega bull market, which began a decade ago. Not only did gold hit a new high during this rise, which follows the pattern, but it was also the longest and strongest C rise in this bull market.

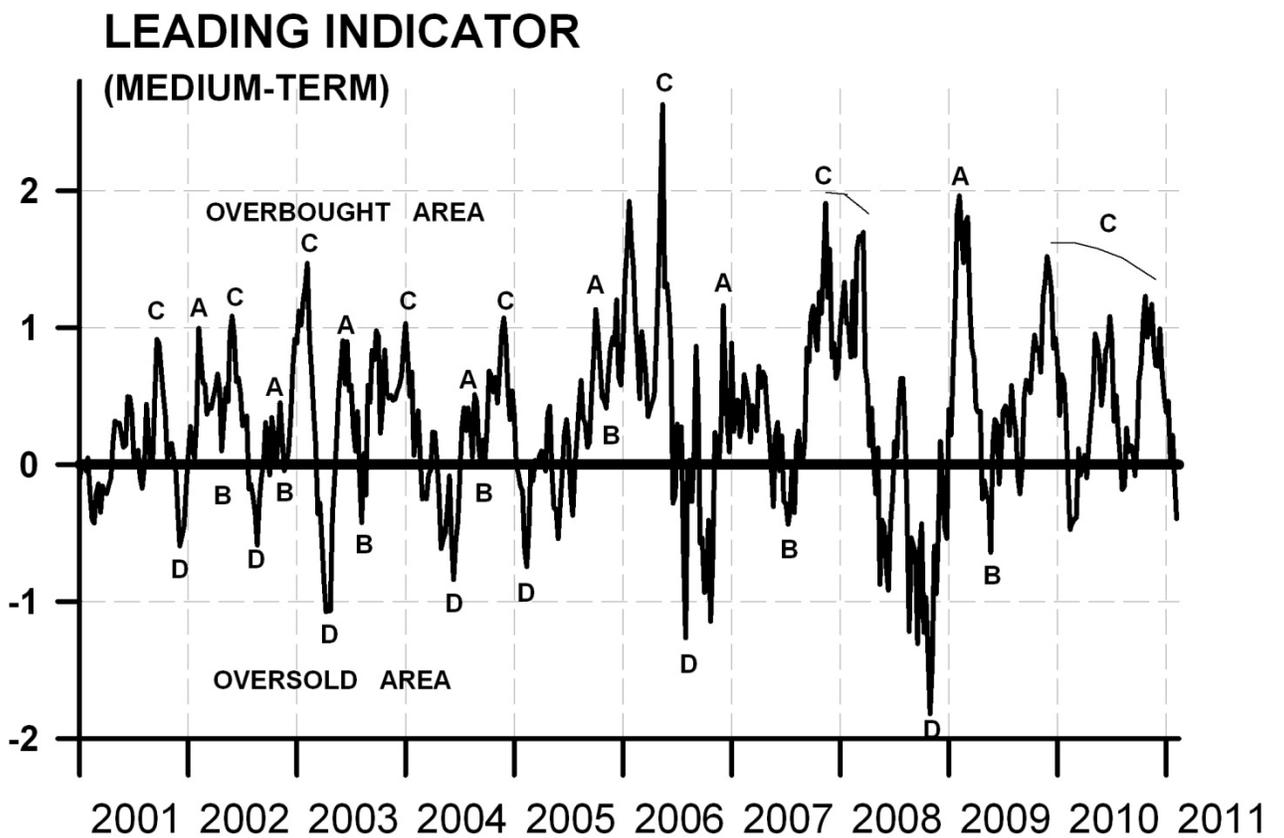

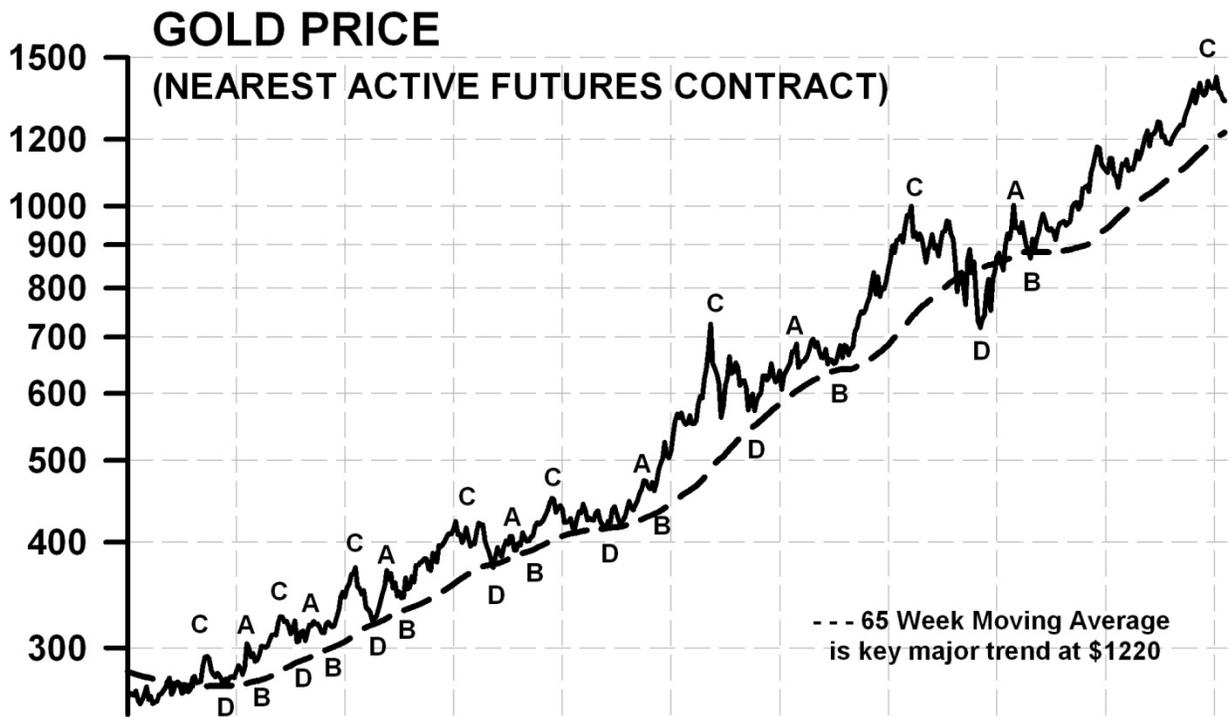

It lasted 21 months and gold rose 64% during that time. This surpassed the last two C rises, which gained 58% in 2006 and 55% in 2007-2008.

As you can see, the rises have clearly grown stronger since 2005 after gold broke above \$500, which was a key level at the time. This is very bullish action, looking at the long-term picture.

So, where do we currently stand?

Note that the leading indicator is currently declining. This tells us that a D decline is getting started, and it's now been confirmed since the indicator just dropped below the zero line. D declines are normal downward corrections following strong C rises. But remember, they do tend to be the sharpest intermediate declines in the bull market cycle.

Since the bull market began in 2001, the gold price has had seven D declines. The worst one was in 2008 when gold fell almost 30% during the financial crisis meltdown. This was an extreme case in an extreme situation.

Based on the averages since 2001, D declines usually last about four months. (But since the 1970s, they've been as short as one month to as long as seven months.) Percentage declines since 2001 have varied from 7% to 30% with the average being 15%.

Since this bull market is getting stronger, however, it wouldn't be surprising if the current D decline ends up being a shorter and less extreme one, but we'll let the market tell us.

Once the indicator gets down to a more oversold area, it will help signal that the end of the downward correction is near. This will provide an ideal buying opportunity for long-term gold holders who want to add to their positions. It'll also signal a profit taking time for those who are short and/or short-term traders.

For now, downward pressure on gold, silver, and the gold and silver shares will likely continue, at least in the weeks ahead. During D declines, it's normal for gold to fall to near its 65 week moving average. The only exception was when gold fell below it during the 2008 crisis.

This average is currently at \$1220, so that would be a likely downside target for the current D decline. Interestingly, that would be about a 15% decline from the January peak, which would coincide with the average for previous D declines.

We'll be keeping you posted, but that's our current outlook for this intermediate decline. In the meantime, here's what the technicals are showing this week...

***Tech Talk:*** The correction we've been waiting for since the new year is here!

All of our stops for gold futures were triggered as gold closed below our key convergence level at \$1355. Also, most of our stops for gold shares were triggered as well. Traders who have been shorting as per our recommendation are gaining on their trades and most likely we'll reach our first profit target this week!

A triple top since November is confirmed. Gold has declined 7% since early Dec when gold reached its intraday high of \$1432.50. We have not seen a decline greater than 14% in over two years, and this correction is suggesting more weakness to come.

Again, this represents a great opportunity to sell short and take advantage of the decline as we have been recommending. Remember, selling short is like being long, it's only a trade. We encourage investors and traders to sell short so you can take advantage of the decline just as you do with the rises.

Gold's break below the neckline support of the Dec/Jan H&S top also confirmed the H&S formation and gold's on its way to our initial downside target at \$1300-1285. First though, the Oct low at \$1320 is a key support that, if broken, would reconfirm gold's steady decline and then the \$1285 level, or possibly lower, would be a likely target.

Volume has been high on dips and low on gains, meaning gold is poised to decline further. Traders are looking to get out of gold as confidence in U.S. and Europe's economies is improving, making other investments more attractive. Moreover, talk about gold being in a bubble is making some traders bank profits or cut losses short. This is typical action during an intermediate peak, as we've seen over the last few months.

The bigger picture tells us the opposite as the emerging economies have been buying more gold to add to their reserves, as well as creating incentives for their citizens to invest in gold.

For example, the ICBC Gold Accumulation Plan (ICBC GAP) launched in China in Dec 2010 has had an important response as over a million accounts were opened at the onset of the program, as announced by the World Gold Council (WGC). The ICBC GAP is a product designed to provide investors in mainland China a way to accumulate gold in small amounts with minimum purchases of a gram at a time.

The gold share story is similar as the HUI Index and Advance Decline line are breaking to new lows by the day! Both have fallen below the Nov lows and are looking to test the Oct lows. A break below the Oct low would suggest that gold is headed in the same direction.

On the other hand, a clear break above the January downtrend line would signal a bounce in the gold price could occur first before the full correction develops. A break above the Dec downtrend line, however, would show bullish action, likely taking gold to new high territory. Remember, gold shares have been leading gold in this decline and they will likely lead gold out of it as well. Keep on eye on these and the other indicators as they are telling us the story.

## COMEX GOLD FEB FUTURES - DAILY - 6 MONTH VIEW

(GC2011G) N.Y. GOLD 11G DAILY 1/25/11 C= 1331.20

**What to do?** Sell short Feb gold after a 1dc below \$1320. Place a stop after a 3dc above entry level and look to cover half at \$1285. For long positions, look to reenter after a 2dc above \$1370; stop at \$1355.

## COMEX GOLD FEB 2011 FUTURES CX 15 WEEK

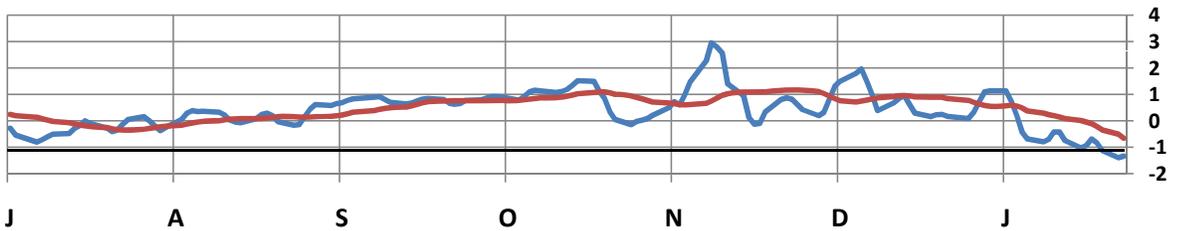

**Comex gold Feb 2011 futures Cx 480 min tick chart (all sessions)**

Open trades:	Long at:	Sold short at 1345. Sold long positions via stop loss at 1345.50.
	Stop:	M/T Stop triggered! S/T stop triggered 2 weeks ago. Short positions stop at 3 points above entry level.
	Profit targets:	<b>Short Positions:</b> 1335 (reached), 1320, 1285. <b>Long Positions:</b> 1395, 1422 &/or 1440.
New Recom:	You are short. Keep short positions. If out, sell short Feb again after 1 dc below 1320. Stop at 3dc above entry level, cover half at 1285. On the upside, wait to buy after a 2dc at or above 1370.	
Comment:	Break below NL resistance confirms triple top and H&S formation as warned last week. Complete H&S formation has a downside target of 1320. If breaks below 1320 could decline further to 1285. Great opportunity to gain on short positions! Wait for break to buy above the Jan downtrend line after a 2dc at or above 1370.	

**(SI2011H) N.Y. SILVER DAILY 1/25/11 C = 26.805**

SPINNER (3, 16, 16) -1.33 -0.65

Open trades:	Long at:	Some took profits via profit/stop loss at 27.80 :). Others sold at 27.50
	Stop:	All stops triggered last week! Sold via stop/loss at 27.80 and 27.50
	Profit targets:	Long Positions: 30, 32 &/or 35.
New Recom:	Look to reenter after a 1dc at or above 29.50. Sell Mar short after a 1dc below 25.50.	
Comment:	Forming an intermediate top area within an Oct - Jan upchannel. Fell to bottom of Jan downtrend channel. A clear break below both channels would signal bearish activity for the short term. Spinner is at its 11 mo low, which tells us that the 25.50 level may hold. Have patience and look for signs to act!	

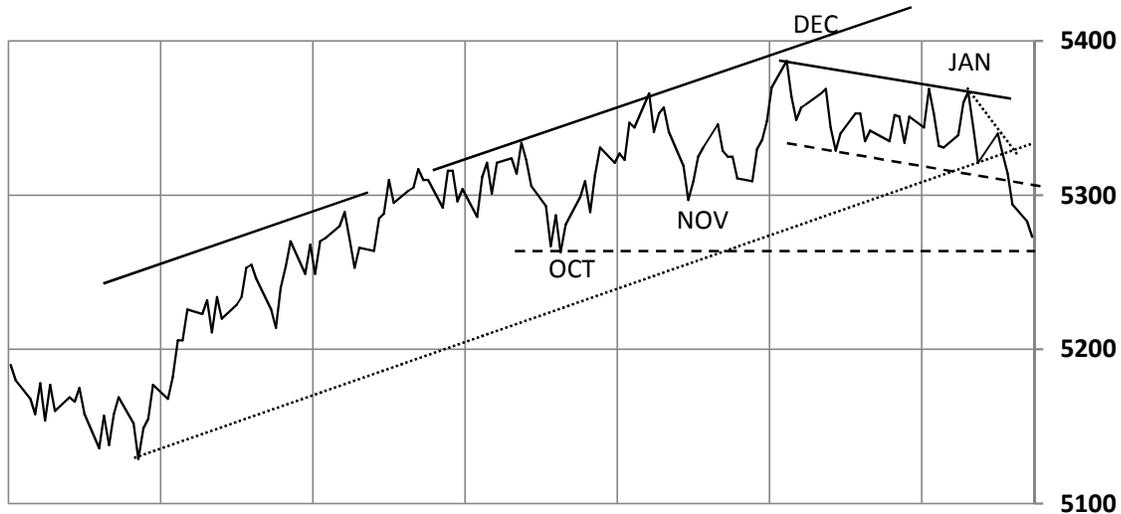

## HUI GOLD BUG INDEX (INDEX) DAILY 1/25/11 C = 497.99

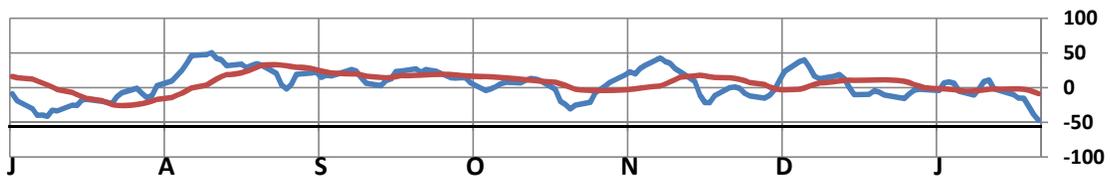

### HUI GOLD BUG INDEX DAILY

**Comment:** Gold shares continue to decline steadily within Jan downtrend channel. After breaking well below Nov lows, it's now testing Oct lows. This Oct support is new key S/T as a 1dc below 495 would confirm short term bearish action. The Jan downtrend is becoming an important resistance level. A break above it would be a possible reversal in this new year trend. Gold continued to follow gold shares down when it declined below key support level at 1355, and no signs of a reversal yet. Spinner in oversold area which tells us that we might see a short bounce up before it continues to decline further. Be careful of fake out rises, and for now stay cautious.

## GOLD STOCKS ADV/DEC LINE DAILY CHART 1/25/11 C=5273

SPINNER (3, 16, 16) -47.35 -8.57

### Schultz Gold Stocks Advance&Decline Line (SGS A/D) daily chart:

Comment:	Fell sharply to Oct lows today. Broke below Dec - Jan downtrend channel, and below Aug - Jan uptrend channel. Jan downtrend line has formed a descending triangle and vulnerability persists below it. Oct low has now become next key support level. A break below it would confirm bearish action for both gold shares and gold. Spinner in oversold area but could stay low for the short term.
----------	--

# GOLD SHARES

AEM -- AGNICO EAGLE MINES LT-DAILY 1/25/11 C = 67.44

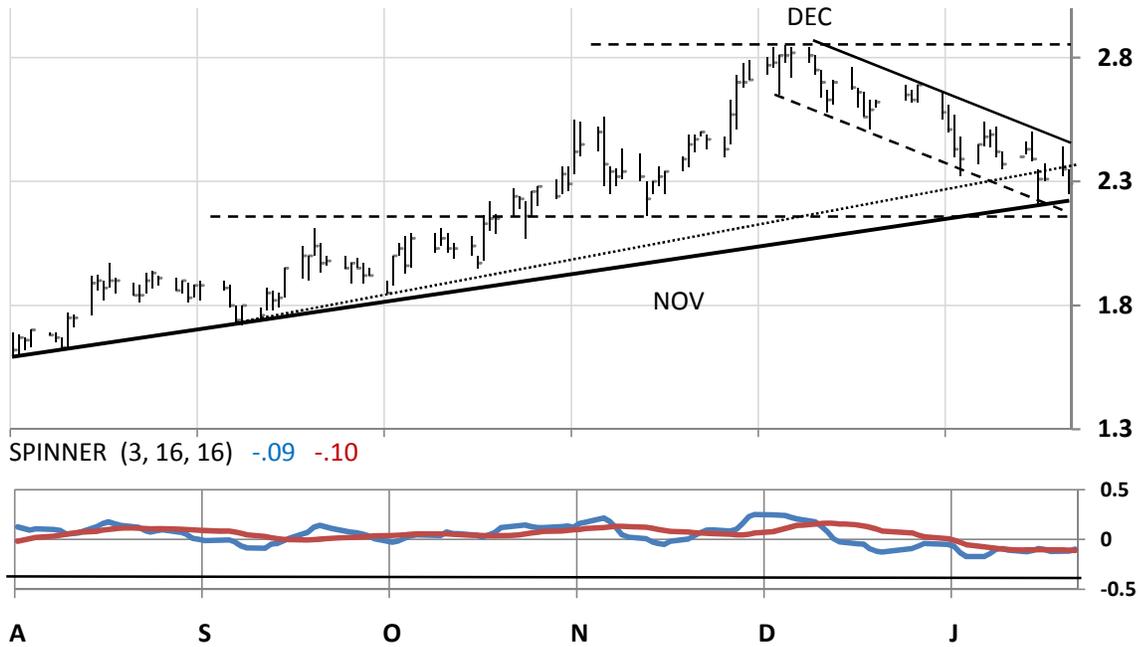

**Agnico Eagle Mines (NYSE: AEM; Toronto TSX:AEM-T); gold: US\$**

Open trades:	Long at:	Sold yesterday & today... stop triggered.
	Stop:	M/T profit/loss stop triggered at 67.95 - 68
	Profit targets:	80, 88 &/or 89.45 &/or 92.50 &/or 94.80
New Recom:	Buy more if breaks clearly above Dec - Jan downtrend line after 1 dc above 75. Sell short at market. Place stops 5 points above entry level. Cover half at 60.	
Comment:	Fell below Oct lows, clearly breaking below the neckline resistance thereby confirming Nov - Jan H&S top. That is, AEM could decline further before we see a renewed rise. Moreover, it's been unable to break clearly above the Dec downtrend line, and we're still seeing high volume on the decline. Not a good sign of strength. On the other hand, Dec - Jan symmetrical triangle has formed while the Spinner is bottoming, which would be telling us that a rise is on the way. A clear 1dc above the Dec downtrend line at 75 would be a good sign.	

**(BTO-TO) B2GOLD CORP DAILY 1/25/11**

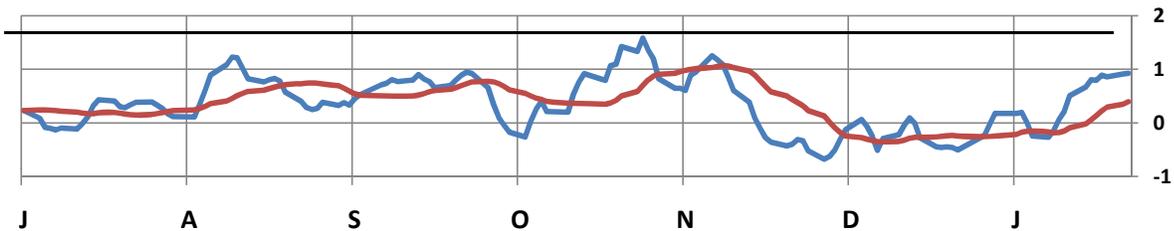

**C = 2.29**

**B2Gold Corp (Toronto TSX: BTO-T); gold: CAD\$**

Open trades:	Long at:	S/T & M/T stops triggered.
	Stop:	Took profits via stops :) at 2.30, others at 2.35
	Profit targets:	2.86 &/or 3.05 &/or 3.15
New Recom:	Wait to reenter (buy) on breakout above Dec downtrend line 2dc above 2.65. Gamblers buy on 1 dc above 2.65. Sell short on 2dc below 2.20. Gamblers short on 1dc below. Place stop at .22 cents above entry level. Cover half at 1.95	
Comment:	Fell to Nov lows. All profit stops triggered after a clear break below the Aug-Jan uptrend line support. Important convergence forming at 2.20 level... The bottom side of Dec downtrend channel, the Nov low and the Aug - Jan uptrend line. A break below the Nov lows would confirm weakness. On the other hand, a break above the Dec downtrend line would be a good time to buy again.	

**(EGU-T) EUROPEAN GOLDFIELDS DAILY 1/25/11 C = 15.16**

**European Goldfields (Toronto TSX: EGU-T; LSE: EGU); gold: CAD\$**

Comment:	No open positions, but waiting to buy since taking profits. Looks firmer than most. Nov downtrend being tested but still has not been able to break clearly above it. Rise has been on high volume pushing Spinner up. A mini rising wedge being formed during Jan telling us that a decline below the 14 level is possible. Buy again only after a 1 dc above Nov high resistance level at 15.82
----------	---

**(SMF - T) SEMAFO DAILY 1/25/11 C = 10.49**

**Semafo Inc(Toronto TSX: SMF-T) gold: CAD\$**

Comment:	<p>May be bottoming. Double downside wedge forming while holding above Aug - Jan uptrend, and Spinner is rising. This is good action to buy back if Dec downtrend is broken on a 2dc above 11.70. Sell short if 2dc below 10, as it would then be a clear break down. Gamblers sell short on 1dc below 10. Place stop at 1.00 above entry level. Cover half at 9.</p>
----------	---

**(SLW) SILVER WHEATON CORP DAILY 1/25/11 C = 29.24**

**Silver Wheaton (NYSE: SLW; Toronto TSX: SLW-T) silver/gold: US\$**

Open trades:	Long at:	Initial entry price: 15.84 (Feb-17-10) Some re-bought at 38.42 and at 36 or 36.75
	Stop:	M/T: 2 dc below 30.50. (Getting close)
	Profit targets:	42.50 &/or 45.80 &/or 48.50.
New Recom:	If long, keep positions but stop is close to being triggered. Buy more again after a 1dc above Jan downtrend line at 36. Sell short on 2dc below 30. Gamblers sell short at market. All place stop at 34.50. Cover half at 26.50.	
Comment:	Downside pressure still persists. Keep an eye on newly found support at key convergence at the 30.50 level. A clear break below it would confirm Nov - Jan H&S top formation with a downside target of 22. Volume has been rising on dips which reflects vulnerability. On the other hand, a downside wedge is forming since the new year with an upside target at 38 which is also the Dec downtrend resistance. A break above Dec downtrend would be bullish activity. Spinner is oversold and looking to rise.	

(TMM - V) TIMMINS GOLD CORP DAILY 1/25/11 C = 2.19

**Timmins Gold Corp (Toronto TSXV: TMM-V) gold: CAD\$**

Open trades:	Long at:	Initial entry price: 1.88 (Aug-16-10). Gamblers re-bought at 2.56 and 2.73
	Stop:	S/T: stop triggered today. M/T: 1 dc below 2.00 (readjusted)
	Profit targets:	2.75 &/or 3.10
New Recom:	Took some profits on S/T position today. M/T traders keep positions. Buy bit after 1 dc above 2.57 or after a dip that holds a 2 dc above 2.20. Buy more after 1 dc above resistance at 2.75. Sell short on 2dc below 2. Place stop at .25 cents above entry level. Cover half at 1.75	
Comment:	Today's breakdown shows weakness, especially if stays below 2.45. Pressure is down S/T. Keep eye on M/T stop. On the upside, Spinner in oversold area. A break above the Jan downtrend line means a rise to test Dec downtrend resistance is likely.	

**(UXG) US GOLD CORP 1/25/11 C = 6.06**

**US Gold Corp (Amex: UXG, Toronto TSX: UXG-T) gold&silver: US\$**

Open trades:	Long at:	Stops triggered this week.
	Stop:	All sold via profit/loss stop. Some made profits :)
New Recom:	Buy new positions on 2dc above 7.50. Sell short on 2dc below 6. Place stop on short at .75 cents above entry level. Cover half at 5.35	
Comment:	All profit/loss stops triggered after H&S top formation was confirmed following gold's lead. Approaching downside target of H&S but still room for more weakness. Spinner is showing oversold extremes, however, which means we could see a bounce up.	

# FUTURES

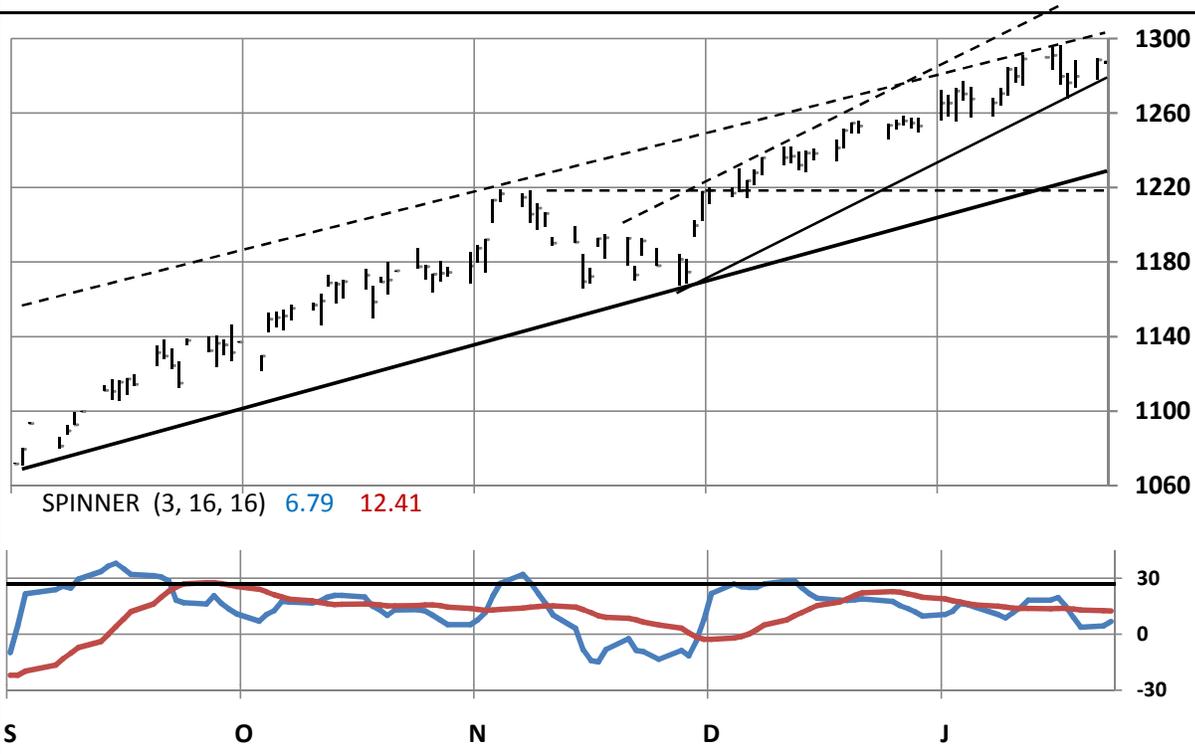

(CL2011H) LIGHT CRUDE OIL-11F-DAILY 1/25/11 C = 86.19

**Crude Oil NY Mar 2011 futures - daily chart:**

Open trades:	Long at:	91.07 (Dec 23rd). Some bought at 89. Others may have bought bit at 91
	Stop:	S/T: stop triggered; M/T: 1 dc below 86. (Getting close)
	Profit targets:	94.50 &/or 98.50
New Recom:	Keep M/T positions.	
Comment:	Weakness in short-term. Mini Cup & Handle failed, and important Dec - Jan sideways band broken on downside today. This means it could test Aug - Jan uptrend line support near 86. This level, if tested, will be key for next direction then.	

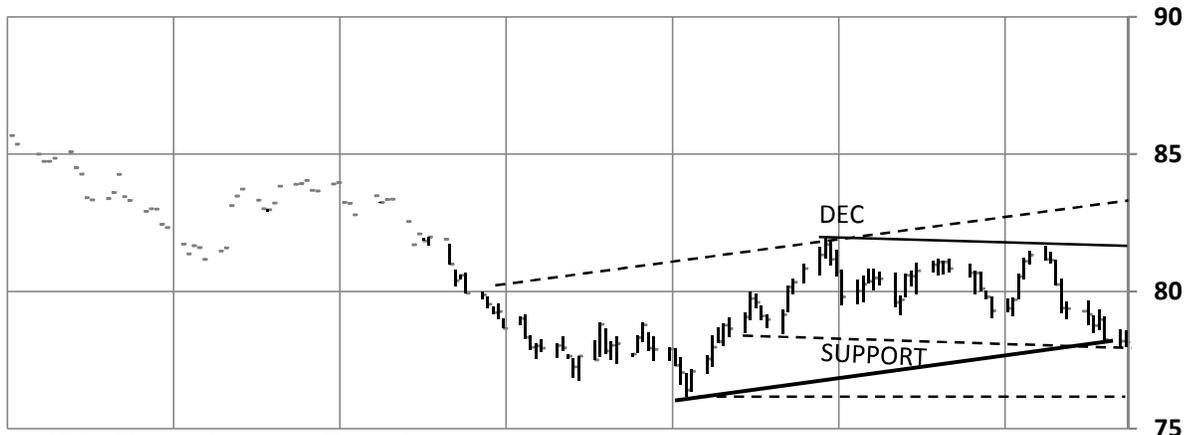

(SP2011H) S&P 500 INDEX -11H-DAILY 1/25/11 C = 1287.70

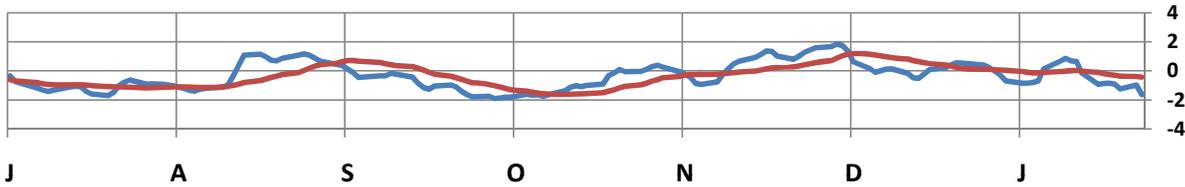

**S&P500 Index Mar 2011 futures - daily chart**

Open trades:	Long at:	Initial entry price: 1227.90 (Dec-09-10). Traders re-bought <u>March</u> at 1238.40, 1249.80 and 1283. Others may have bought at 1280.
	Stop:	S/T: 1240, M/T: 1 dc below 1240 (March).
	Profit targets:	1300.00 &/or 1350
New Recom:	Keep positions. Look to buy more if breaks clearly above top of Sept-Jan uptrend channel at or above 1295.	
Comment:	Looking bullish but has strong resistance at top part of Sept - Jan uptrend channel. A break above it would reconfirm bullish activity and give us a clear sign to buy more! Keep this one on the radar as it can be very profitable in the short term. Spinner declining, suggesting some weakness, but it's very strong above 1265.	

**(DX2011H) U.S. DOLLAR INDEX-11H-DAILY 1/25/11 C=78.145**

SPINNER (3, 16, 16) -1.63 -0.43

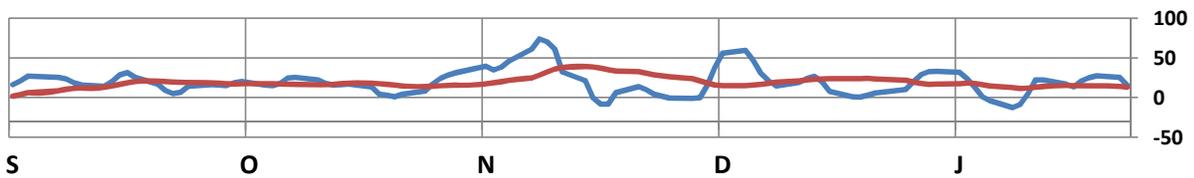

Open Trades	Long at:	Entry Price: 81.10 and 80.
	Stop:	S/T & M/T: 1 dc below 76.
New Recom:	Keep positions. Look to buy more after 1 dc above 82. S/T and M/T sell after 1 dc below 76.	
Comment:	Dipped below 78.50 area, but holding above an important convergence. Need to see a more clear break below it before bearish action is confirmed. Strong support still exists at the 78 level. Keep positions for now as it's most likely to stabilize.	

(PA2011H) PALLADIUM-11H-DAILY 1/25/11 C=784.75

SPINNER (3, 16, 16) 15.31 12.93

<p>Recom:</p>	<p>Palladium holding up well, reaching another high last Wednesday, but now being hit by downward pressure. It continues to resist at top side of rising wedge. Sell March Short on 1 dc below 750, stop at 3 points above entry level, cover at 700. Gamblers sell short a bit at market. On the upside, gamblers buy Mar on 1dc above 835 which would be a break above and out of the topside of wedge.</p>
<p>Comment:</p>	<p>Rising wedge still in the making, but Spinner has room to rise further. This means whichever way it breaks out of the wedge will tell next S/T trend direction. Down pressure dominates.</p>

•**Note:** U should NOT feel our recommended prices are set in concrete. If mkts suddenly feel hot or cold to U, or dramatic news occurs, U can buy or sell, or stop at slightly higher or slightly lower prices. It also hinges on your experience level. Some people can use our prices as guides & know when they can take bigger risks.

**Spinner:** Spinner is an in-house momentum indicator (not always shown on charts). Momentum indicators use the rate of change in price to determine predominant energy flows. Spinner trading signals are generated when the faster timing line crosses above or below the slower confirming line. Upside crosses in the lower range of positive territory offer the most reliable signals for longs; downside crosses in the top range of negative territory for shorts. Avoid trading against the timing line, ie, buying/selling if the timing line is in corrective mode (against direction of trade) unless the confirming line is positioning for a new 'confirming cycle'. It's important to always be aware of location, direction & cycling phase of the confirming line. Spinner signals are more effective in trending mkt's than in trading ranges where indicators such as Stochastics & Williams %R should be used.
